

Milestone 1: Requirement Analysis & Planning

1. Project Title

Auto Ticket Classification using Flow Designer

2. Project Objective

The main goal of this project is to automate the ticket classification process in ServiceNow. When a user creates an Incident ticket, the system will automatically assign the correct Category and Subcategory based on the Short Description. Additionally, an automated confirmation email will be sent to the Caller.

3. Business Requirements

- **Automatic Classification:** Reduce manual ticket assignment effort by automatically routing tickets.
- **Instant Email Notification:** Keep the caller informed immediately after ticket submission.
- **Accuracy:** Automatically set categories based on predefined keywords in the ticket description.
- **Rule 1 (Wi-Fi Issue):**
 - **Trigger:** Short Description contains "**Wi-Fi**" (e.g., "*Wi-Fi not working in library*")
 - **Category:** Network
 - **Subcategory:** Wi-Fi
- **Rule 2 (Projector Issue):**

- **Trigger:** Short Description contains "**Projector**" (e.g., *"Projector not turning on"*)
- **Category:** Hardware
- **Subcategory:** Projector
- **Notification Rule:**
 - Once the ticket is saved and classified, send an automated email to the **Caller's Email ID**.

5. Implementation Plan

1. Set up a ServiceNow Personal Developer Instance (PDI).
2. Configure **Data Lookup Rules** or **Flow Designer** triggers for keyword matching.
3. Create an **Email Notification** template for ticket updates.
4. Test the rules using sample Incident records and verify logs under System Logs -> Emails.
