

Milestone 2: Backend Development & Configuration

1. Objective

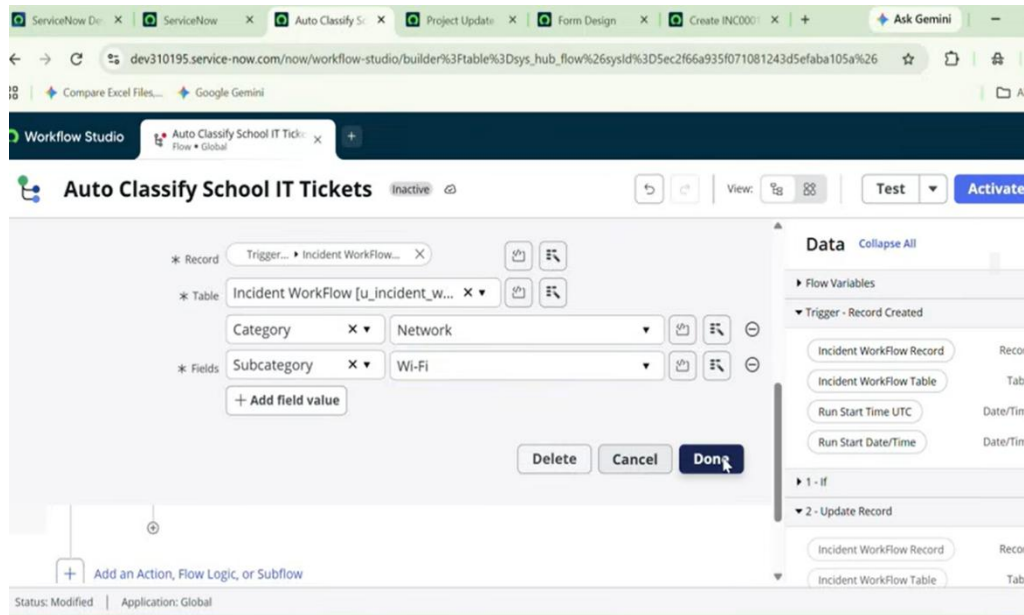

To configure data lookup definitions and field dependencies in ServiceNow so that tickets are classified automatically based on the keywords in the Short Description.

2. Configuration Details

- **Category Definition:** Configured lookup rules mapping keywords to their respective Categories (**Network** and **Hardware**).
- **Subcategory Mapping:** Linked subcategories dynamically based on the selected Category:
 - Keyword "Wi-Fi" → **Category:** Network | **Subcategory:** Wi-Fi
 - Keyword "Projector" → **Category:** Hardware | **Subcategory:** Projector

3. Implementation Steps

1. Created Data Lookup Definitions on the Incident table.
2. Set Matcher Conditions for the Short Description field.
3. Defined Setter Values to automatically assign Category and Subcategory fields upon record submission.

Milestone 3: Automation using Flow Designer & Email Notification

1. Objective

To build an automated workflow using ServiceNow Flow Designer that triggers upon Incident creation/update and sends an automated confirmation email to the ticket's **Caller**.

2. Flow Configuration

- **Trigger:** Created / Updated record on the Incident [incident] table.
- **Filter Conditions:** Executed when Category and Subcategory are populated via auto-classification.
- **Flow Action:** Send Email notification to Caller ID -> Email.

3. Verification & System Logs

1. Tested the flow with sample inputs:
 - **Test 1:** Created ticket with *"Wi-Fi not working in library"* → Auto-filled **Network / Wi-Fi**.
 - **Test 2:** Created ticket with *"Projector not turning on"* → Auto-filled **Hardware / Projector**.
2. Checked outbound email generation under System Logs -> Emails (sys email table).
3. Opened the generated email log and verified the content using the **Preview Email** feature under Related Links.
